**Emergence and maintenance of infectious salmon anaemia virus (ISAV) in Europe: a new hypothesis**

- ILAV er vanleg i naturlege populasjonar av laks og aure i Europa.
- ILAV vert hovudsakleg spreidd i vassdrag i samband med gyting
- Vill Laksefisk er berar av låg-virulente variantar (HPR0)
- Mutasjonar endrar virulensen
- ILA i oppdrett oppstår etter spreiling frå vill laksefisk
  - Mutasjonar anten i villfisk eller i oppdrettsfisk
- Oppdrettsaktivitet viktig for spreiling av ILAV
  - Mellom lokalitatar og til villfisk
- Frekvensen av nye primærutbrot i oppdrett reflekterer truleg naturleg variasjon i prevalensen av ILAV hjå vill laksefisk

**Transmission of infectious salmon anaemia virus (ISAV)  
in farmed populations of Atlantic salmon (*Salmo salar*)**

A. Nylund, H. Plarre, M. Karlsen, F. Fridell, K. F. Ottem,  
A. Bratland, and P. A. Sæther

## **Conclusions**

*The geographical pattern of related ISAV isolates presented in this paper shows that the number of isolates in circulation during the last five years is limited, and that these are transported over long distances in connection with egg and smolt transports.*

*.....the possibility that only avirulent ISAV isolates are vertically transmitted, may explain why ISA most often occurs at marine sites and why no more than about 15 farms get ISA every year in Norway*

Scientific Committee for Food Safety  
26.01.07**

**Which risk factors relating to spread of Infectious Salmon Anaemia (ISA)  
require development of management strategies?**

***II. PROBABILITY OF SPREADING THE DISEASE AS A RESULT OF VERTICAL TRANSMISSION***

If the spread of the disease is to be considered a consequence of the vertical transmission of ISA virus then certain central observations should be taken into account. The small number of outbreaks in fresh water stage (0.7 %) and the absence of ISA in some countries that over the years have imported substantial numbers of eggs from Norway suggest that the probability of the disease occurring as a result of vertical transmission of the agent is low.

In conclusion, the present work constitutes the first report of a case of ISA in farmed Atlantic salmon in Chile. The clinical signs and lesions are consistent with the classical descriptions of the disease in marine-farmed Atlantic salmon in the Northern hemisphere. The outbreak was caused by ISAV of European genotype (or Genotype I) of HPR 7b but distinct from common European Genotype ISAV isolates.

ORIGINAL ARTICLE

## ISA virus in Chile: evidence of vertical transmission

Siri Vike · Stian Nylund · Are Nylund

- .....*the close relationship between contemporary ISA virus strains from farmed Atlantic salmon in Chile and Norway suggest a recent transmission from Norway to Chile.*
- *Norway export large amounts of Atlantic salmon embryos every year to Chile; hence, the best explanation for the Norwegian ISA virus in Chile is transmission via these embryos, i.e. vertical or transgenerational transmission.*
- *This supports other studies showing that the ISA virus can be transmitted vertically.*
